Music~~ABSTRACT~~

ABSTRACT

A catalog of chords on root 1 is compiled. The chords are listed in 4 tables as to the position of bass, tenor, alto and soprano. The chords can be shifted to other root positions. In order to choose a chord to follow a given chord, a root motion and the voice in which a common tone is to be held are chosen by chance with certain preassigned weightings. By means of simple relations, the chords fulfilling these conditions are located in the catalog and one of these is chosen by chance. Five short pieces composed in this manner are presented.

MEMORANDUM FOR FILE

The first attempt to produce random music resulted in sixteen measures of four chords each. To facilitate selection of chords a catalog of 68 chords in one key was compiled, admitting all intervals but a 7th, and restricted by the ranges and intervals between voices. The ranges allowed were

Intervals of more than an octave were allowed between tenor and bass, but not between soprano and alto or between alto and tenor. It was further required that each chord should have a tone in common with the preceding chord.

The actual selection of chords was accomplished with the aid of a table of four-figure random numbers. The first figure specified the octave in which the root was to be placed, the range covering three full octaves, and the digits 1, 4, 7 indicated the first, 2, 5, 8 the second, and

3, 6, 9 the third octave. The root was given by the second of the four figures, according to the following scheme. If the digit was a number from 1 to 6, the corresponding root was used. If the digit was 7, 8, or 9 it was replaced by the appropriate root given in the table below, thus eliminating sevenths and introducing the possibility of a slight pattern in root choice. The pattern was to be repeated for each group of eight measures.

Measure	Root to be used				Measure	Root to be used			
1	1	4	5	2	5	1	4	5	2
2	3	6	3	6	6	3	6	3	6
3	2	5	4	1	7	6	3	6	3
4	6	3	6	3	8	2	4	5	1

The last two figures of the four-figure random number specified the catalog number of the chord.

Chords were chosen by this method, maintaining the common tone restriction, etc., and specifying that measures five and six repeat one and two, and the accompanying Random I is the result.

This method proved to be extremely slow, and gave rise to crossed voices and doubled tones which were not desirable. A means of simplifying the choice was found by the use of a new notation and an improved catalog.

The notes in the range being given numbers as follows

each chord could be expressed in the form

$$R_m C_m = S_m A_m T_m B_m$$

where R_m indicated the root of the mth chord, m indicated the number of a chord in a sequence of chords, C is the number of the chord in the catalog and S_m etc. were the actual notes of each voice of the mth chord. For example, the chord

in the new notation would be $1, 9, 11, 13$.

The new catalog consisted of four sub-catalogs, the complete set of chords being listed in each sub-catalog according to voice. Each sub-catalog was divided into groups corresponding to the various possible positions for

the particular voice. Thus the first, or soprano, sub-catalog consisted of six groups of chords, a group of twenty-four corresponding to $S = 11$, a group of forty chords possible with $S = 13$, etc., and similarly for the alto, tenor and bass. This complete catalog is found in Appendix I.

The first chord was chosen at random. The next and successive chords were found by the following process. The root and the voice to be held as common tone were chosen at random as was an index, + or -, indicating motion up or down the staff. The common voice was translated to a position, corresponding to a root-C position for the chord being found, by the relations

$$\begin{array}{ll} m + n +, (V_n)_C = V_m - R_n - 1) & \text{Where } (V_n)_C \text{ indicates a} \\ m + n -, (V_n)_C = V_m + 8 - R_n & \text{voice of the } n\text{th chord} \\ m - n +, (V_n)_C = V_m - R_n - 6 & \text{in C-root position.} \\ m - n -, (V_n)_C = V_m - (R_n - 1) & \end{array}$$

The number of the common tone being thus determined, the group of chords having this note in the desired voice was found in the catalog and a chord chosen at random from this group. This chord was then translated from the catalog or C-root position to the corresponding position for the chosen root by means of the following relations:

$$m + n +, V_n = (V_n)_C + (R_n - 1)$$

$$m + n -, V_n = (V_n)_C + (R_n - 1) + 7$$

$$m - n +, V_n = (V_n)_C + (R_n - 1) - 7$$

$$m - n -, V_n = (V_n)_C + (R_n - 1)$$

For example, suppose the first chord, chosen at random, was $1,6_4 = (18, 15, 11, 6)$.

The dice, when thrown, gave 5, +, and A. The new chord, therefore was to be built on root 5, with motion up the staff and the alto held constant. The alto of the first chord was then translated from note 15 to note 11, the position corresponding to a root-C position of the second chord. From the catalog a random choice was made from the chords having A = 11, giving $(13, 11, 4, 1)$. This chord was then translated to root 5, or $5,32_2 = (17, 15, 8, 5)$.

Using this system of progression, Random II was produced. Here, as in Random I, measures 1 and 2 reappear as 5 and 6. In addition it was specified that chords 1, 16, and 32 be built on root 1, and chords 15 and 31 be built on either root 4 or root 5.

An attempt to introduce some scale pattern was then made, but soon abandoned, since it had been found that the new enlarged catalog also produced far too many doubled voices. To remedy this, a third catalog was compiled with the chords subject to the restriction that root, third and

fifth be present in each chord. A total of fifty-nine chords met this restriction, and form Appendix II.

With the short catalog, Randoms IV, V and VI were rapidly developed. The same conditions were imposed as in the earlier attempts. For each chord the root, voice, and index are chosen by a throw of the three dice, and the position of the tone to be held common is noted. The catalog is entered, and one of the entries corresponding to this voice position is chosen with the aid of a random number table. The chord is translated to its final position as in the earlier methods, and so on for the succeeding chords.

This results in a simple, rapid method, one which could easily be set up systemically in file form. Each chord could be entered, together with all possible following chords. Since the number of possible chords is small, this would not be impractical, even considering the number of available roots and positions. The problem then would be a completely mechanical one, the first chord being chosen at random and the succeeding choices being made from the indicated groups in the file.

The various pieces have been played over a number of times. The surprising thing about them is that they sound rather musical. Dr. D. P. Ling was able to render them more acceptable by adding a certain amount of phrasing and "expression" in playing them. Random IV seems to be the best;

Random I is rather striking, with Random VI perhaps a third choice. A tape recording has been made of these three, and it is available to the curious.

By a change of rules, the character of the product could certainly be changed and could probably be improved. For instance, requiring a common tone in succeeding voices rules out many progressions, as, from the fourth to the fifth.

Other defects of the present scheme are the neglect of rhythm and the lack of any connection of longer range than that of a chord with the preceding chord.

An observed defect is that the voices tend either to cling to one note or to jump wildly. Perhaps something could be added to favor a melodic line in at least one voice.
